

CODE and Features - Owned By SD Team

Release to PROD and Post Release SMOKE Test - TO Team

CASE -1: New Project Creation Request

CASE-2: Build and Release Pipeline Request for existing Resource (Like GIB)

Creation of release Branch - a signal of handover from SD ==> TO team

To be approved by Br. Samir (first) ==> code is correct [features]
only then

Approved by Br. Mudassar ==> Platform is healthy

Question: Why Another Branch -- its useless

- Immutable snapshot ensures UAT-approved code is exactly what goes to Production.
- PR approvals on a release branch provide the required audit trail for regulatory compliance.
- Release branch enables clean, isolated hotfixes without deploying unfinished work from main.

Dev to mention BuildID in PR, so Br. Mudassar can verify if UAT was successful or no

> Automated Rule to reject PR if commit msg does have build ID
